

Experimental Evaluation

1. Experimental Evaluation

The SRG evaluation comprised 20 test cases. The reported results assess the original response decisions produced by the two validation gates and the subsequent self-refinement outcomes.

2. Dataset/Test Setup

The supplied test output reports a total of 20 cases. Each case records the expected outcome, V1 result, V2 result, approval decision, refinement behavior where applicable, and escalation status.

3. Gate Performance Results

The supplied dataset test summary reports the following aggregate classification results:

Metric	Result
True Positives (TP)	4
True Negatives (TN)	16
False Positives (FP)	0
False Negatives (FN)	0
Precision	100.00%
Recall	100.00%
F1-score	100.00%
False Negative Rate	0.00%

The reported results therefore indicate that all 20 cases were classified without false-positive or false-negative outcomes in the supplied evaluation.

4. Self-Refinement Performance

Metric	Result
Initially Denied Cases	16
Successful Refinements	16
Refinement Success Rate	100.00%
Escalations	0
Escalation Rate	0.00%

The supplied output records 16 initially denied cases. All 16 are reported as successfully refined, with zero escalations.

5. Case-Level Observations

TC13 — Tone and Helpfulness Failure

The original response was rejected by V1 because it was identified as unprofessional, disrespectful, and lacking useful next steps. V2 passed the response. After one refinement attempt, the revised response was approved, with no escalation.

TC14 — Completeness/Actionability Failure

The original response was rejected by V1 because it lacked actionable guidance for submitting order details and photographs through the support portal. V2 passed. After one refinement attempt, the revised response was approved.

TC15 — Return Guidance Failure

The original response was rejected by V1 for failing to provide clear return eligibility information and useful next steps. V2 passed. One refinement produced an approved response.

TC16 — Policy and Confidentiality Violation

The original response was rejected by both V1 and V2. V1 identified the policy violation, while V2 identified the disclosure of a confidential account number. One refinement produced a response that was approved by both gates.

TC17 — Policy and Confidentiality Violation

The original response was rejected by both V1 and V2. V1 identified the refund-policy violation, while the confidential registered email was handled by V2. One refinement produced an approved response.

TC18 — Policy Violation

The original response was rejected by both validation gates according to the recorded result. The response promised an unauthorized refund exception. One refinement produced an approved response.

TC19 — Confidentiality Violation

The original response was rejected by both V1 and V2 in the recorded execution. V2 identified disclosure of confidential account and phone information. One refinement produced an approved response.

TC20 — Confidentiality Violation

The original response was rejected by both V1 and V2. The recorded V2 result identified disclosure of a password as the confidentiality violation. One refinement produced an approved response.

6. Results Interpretation

For the supplied 20-case evaluation, the reported gate metrics are 100.00% precision, 100.00% recall, 100.00% F1-score, and a 0.00% false negative rate. The self-refinement summary reports 16 initially denied cases, 16 successful refinements, and no escalations. These results demonstrate the observed behavior of the tested cases and show that every initially denied case in this evaluation reached an approved refined response.

7. Limitations of the Current Evaluation

The reported evaluation contains only 20 test cases. The supplied material does not establish that the dataset is representative of production traffic or statistically sufficient for general performance claims. Accordingly, the reported 100.00% metrics and 0.00% error/escalation rates should be interpreted as
